# Physics hints and benchmark completion at High effort

13 frozen tasks, three repeats per condition. 351 observations: 313 local and 38 historical controls.

## Observed frontiers with complete costs

## All outcomes, including execution errors

Frontiers use only 4 of 9 settings with complete costs. Missing or uncertain costs exclude the other 5.

Above bars: completed passes out of 39. Below zero: execution errors. Errors do not establish physics failures.

Luna uses historical controls with different CLI version, date and concurrency. Local scheduling changed from 3 to 6 trials sharing 8 CPUs.

These are descriptive comparisons. Seven Prime observations retain uncertain charges; spending reserves are not confirmed costs.
